Cell Structure Study Guide

CLASSWIRE · OFFLINE DEMO SAMPLE

Learning goals

- Identify the major structures of plant and animal cells.
- Explain how organelles work together to maintain cell function.

Key structures

- Nucleus — stores genetic information and coordinates cell activity.
- Mitochondria — convert energy from nutrients into ATP.
- Cell membrane — regulates what enters and leaves the cell.
- Ribosomes — assemble proteins from amino acids.
- Chloroplasts — capture light energy during photosynthesis in plants.

Check your understanding

- Which organelle contains most of a cell’s DNA?
- How does the cell membrane help maintain homeostasis?
- Why do muscle cells contain many mitochondria?
